Electrolysis

A permanent method of removing unwanted hair, an alternative to laser hair removal. Suitable for all hair types including light, blond, grey, white and downy hairs. The treatment inserts a probe, the width of a hair, into the hair follicle, delivering an electrical current, that passes down the probe to heat & destroy the hair's root, preventing further hair growth. This method can take time but is very effective to remove unwanted hairs.

Which is best Laser or electrolysis?

Laser therapy and electrolysis both produce longer-lasting effects compared to shaving. Electrolysis seems to work the best. The results are more permanent. Electrolysis also carries fewer risks and side effects, and you don't need the maintenance treatments required for laser hair removal.

Electrolysis is your one-way solution for a more permanent and efficient method to remove grey / white hair. It is the only FDA approved hair removal method, medically recognized to be PERMANENT. Electrolysis is usually conducted by a skilled technician and is a very precise work. It can be a long tedious process but it is the only method by which white hairs can be removed, Laser does not work on light / white hair. Thus Electrolysis of the hair is the only method of permanently removing hair.
